

Trainor Modular Walls can eliminate the use of landfills from both production and field installation uses.

An office space with a floor plan consisting of 10 rooms, and an annual relocation rate (ARR) of 2 rooms over an 8-year period would result in saving the following from being dumped into a landfill.

Traditional drywall construction produces:

- 560 linear feet of drywall = 93 cubic yards of trash
- 240 outlets, boxes, and switches
- 1,200 feet of conduit
- 5,000 square feet of vinyl wall covering
- 1,000 linear feet of vinyl base wasted

3 Huge "40 Yard" dumpsters' worth

99% of Trainor Modular Walls materials are recyclable and reusable!
